🗨️ Ask Your Data

Ask a question about your data

the percentage of rides cancelled and reasons

As an expert Business Intelligence Analyst, I can help you understand the dynamics of ride cancellations within your dataset.

To determine the percentage of rides cancelled and their reasons, we need to perform the following calculations:

1. **Calculate Total Rides:** This is the total number of entries in your dataset, representing all booking attempts.

- **Metric:** Count of all unique 'Booking ID's'.

2. **Identify Total Cancelled Rides:** Cancelled rides are those where the booking did not result in a completed trip due to a cancellation event. Based on your `booking_status` column, these typically include:

- 'Cancelled by Customer'
- 'Cancelled by Driver'
- 'No Driver Found' (This indicates a system cancellation where no driver was available, effectively a cancellation from the user's perspective).
- **Metric:** Sum of bookings where 'Booking Status' is 'Cancelled by Customer', 'Cancelled by Driver', or 'No Driver Found'.

3. **Calculate Overall Cancellation Rate:** This shows the proportion of all bookings that end up being cancelled.

- **Calculation:** $(\text{Total Cancelled Rides} / \text{Total Rides}) * 100$

4. **Breakdown of Cancellation Types by Source:** To understand *who* is cancelling or *why* the cancellation occurred at a high level, we'll categorize cancelled rides based on their 'Booking Status':

- **Metric:**
 - Count of rides with 'Booking Status' = 'Cancelled by Customer'
 - Count of rides with 'Booking Status' = 'Cancelled by Driver'
 - Count of rides with 'Booking Status' = 'No Driver Found'
- **Calculation:** For each category, calculate its percentage relative to the *Total Cancelled Rides* to see its contribution to overall cancellations, and also its percentage relative to *Total Rides* to see its overall impact.

5. **Detailed Reasons for Cancellation:**

To gain deeper insights, we will analyze the specific reasons provided for cancellations by customers and drivers.

- **Customer Cancellation Reasons:**
 - **Metric:** For rides where 'Booking Status' is 'Cancelled by Customer', count the occurrences of each unique value in the 'Reason for cancelling by Customer' column.
 - **Calculation:** For each specific customer reason, calculate its percentage out of all 'Cancelled by Customer' rides. This helps identify the most common pain points leading customers to cancel.
- **Driver Cancellation Reasons:**
 - **Metric:** For rides where 'Booking Status' is 'Cancelled by Driver', count the occurrences of each unique value in the 'Driver Cancellation Reason' column.
 - **Calculation:** For each specific driver reason, calculate its percentage out of all 'Cancelled by Driver' rides. This highlights common operational issues or driver concerns.

Business Insights & Recommendations:

Once these calculations are performed, you will have a clear picture of your cancellation landscape. Here's what you should look for and how to interpret the results:

- **High Overall Cancellation Rate:** A high percentage suggests potential issues across the platform. This could indicate poor matching algorithms, driver availability problems, pricing concerns, or customer experience issues.
- **Dominant Cancellation Source:**
 - **"No Driver Found" as a major contributor:** This points to a supply-side problem. You may need more drivers in certain areas or during peak times, or your demand prediction isn't accurate. This directly impacts customer satisfaction and can lead to users switching to competitors.
 - **"Cancelled by Customer" as a major contributor:** Investigate the specific reasons (step 5). Are customers finding better options, encountering long wait times, or experiencing last-minute changes? This could be a critical indicator of customer dissatisfaction.
 - **"Cancelled by Driver" as a major contributor:** Again, dive into the specific reasons (step 5). Drivers might be cancelling due to low fares, unsuitable ride distances, uncomfortable passengers, or issues with pickup locations. Addressing these can improve driver retention and service quality.
- **Specific Reason Deep Dive:**
 - If 'Long Wait Time' is a top customer reason, focus on improving driver availability or matching efficiency.
 - If 'Unsuitable Pickup Location' is a top driver reason, consider better mapping, clearer instructions for drivers, or adjusting service areas.
 - If 'Vehicle Breakdown' is a reason (even for incomplete rides, it's a quality issue), this points to fleet maintenance or driver vehicle quality checks.

By performing these analyses, you can identify specific areas for improvement, such as optimizing driver allocation, refining pricing strategies, enhancing user interface for booking, or improving driver incentive programs, all aimed at reducing cancellations and improving the overall ride-hailing experience.

AI Insights

Gemini Business Insights

As a Senior Business Intelligence Analyst, I have reviewed the provided generic dataset on ride bookings. The dataset contains 150,000 records across 21 columns, detailing various aspects of the ride lifecycle from booking to completion or failure.

Key Business Insights:

- Ride Volume & Scope:** The dataset covers 150,000 ride booking records, indicating a substantial operational scale for a ride-hailing or delivery service.
- Ride Status Diversity:** Bookings are categorized into various statuses, including 'Completed', 'Incomplete', 'No Driver Found', and implicitly, cancelled by customer or driver (indicated by respective columns). This allows for a comprehensive understanding of the entire ride lifecycle and its failure points.
- Operational Metrics Available:** Key operational metrics such as `Avg_VTAT` (Vehicle Arrival Time at Pickup) and `Avg_CTAT` (Customer Arrival Time at Pickup) are present, which are crucial for evaluating pickup efficiency.
- Financial & Performance Metrics:** `Booking Value` and `Ride Distance` provide insights into revenue generation and service utilization for completed rides. `Driver Rating` and `Customer Rating` offer direct feedback on service quality from both sides of the transaction.
- Payment Method Tracking:** The `Payment Method` column allows for analysis of customer payment preferences and potential implications for financial operations.
- High Data Sparsity for Failure Details:** A total of 1,123,500 missing values out of 3,150,000 cells (approx. 35.6% missing) suggests that many columns, especially those related to cancellations (`Reason For Cancelling By Customer`, `Driver Cancellation Reason`) and incomplete rides (`Incomplete Rides Reason`), `Avg_VTAT`, `Avg_CTAT`, `Booking Value`, `Ride Distance`, and ratings, are conditionally populated based on the `Booking Status`. This is expected, as these details are only relevant for specific booking outcomes.

Important Trends (Potential, based on available data structure):

- Temporal Analysis:** The `Date` and `Time` columns enable detailed time-series analysis. This would allow for identifying peak hours/days for bookings, seasonal trends in demand, variations in cancellation rates over time, and trends in average booking value or ride distance. *Specific trends cannot be calculated without aggregating the dataset.*
- Geographical Hotspots:** `Pickup Location` and `Drop Location` can be used to identify high-demand areas, popular routes, areas with higher incidence of 'No Driver Found' status, or regions with elevated cancellation/incomplete ride rates. This can inform driver allocation and marketing strategies. *Specific trends cannot be calculated without aggregating the dataset.*
- Vehicle Type Performance:** Analyzing `Vehicle Type` in conjunction with `Booking Status`, `Booking Value`, and `Ratings`, can reveal preferences, profitability, or service quality differences across different vehicle types (e.g., eBike, Go Sedan, Auto, Premier Sedan, Bike).
- Cancellation/Incomplete Reason Trends:** By aggregating the `Reason For Cancelling By Customer`, `Driver Cancellation Reason`, and `Incomplete Rides Reason` fields, recurring issues can be identified over time, indicating evolving operational challenges or customer/driver pain points.

Risks or Problems:

- High Rate of Unfulfilled Bookings:** The presence of 'No Driver Found' as a `Booking Status` (as seen in sample data) is a significant problem. It indicates a mismatch between customer demand and driver supply, leading to lost revenue opportunities and poor customer experience.
- Service Reliability Issues:** 'Incomplete' rides (as seen in sample data, e.g., due to 'Vehicle Breakdown') directly impact customer satisfaction and trust. High rates of incomplete rides suggest underlying operational or vehicle maintenance problems.
- Cancellation Rates:** Both `Cancelled Rides By Customer` and `Cancelled Rides By Driver` represent inefficiencies and lost revenue. Understanding the dominant `Reason For Cancelling By Customer` and `Driver Cancellation Reason` is crucial for mitigation. Without aggregation, the overall rate is unknown, but their mere presence signifies a problem area.
- Operational Delays:** `Avg_VTAT` and `Avg_CTAT` can highlight potential delays in driver assignment or customer readiness, which can impact overall service efficiency and customer satisfaction. High average times in these metrics would indicate a problem.
- Customer/Driver Retention Risk:** Frequent cancellations (by either party), low `Driver Rating`, or low `Customer Rating` can lead to churn. Dissatisfied customers may switch to competitors, and unhappy drivers may stop using the platform.
- Data Sparsity for Detailed Analysis:** While expected, the high number of missing values for specific reasons and performance metrics means that a comprehensive analysis across all dimensions for every ride record is not possible. For instance, detailed reasons are only captured for cancellations or incomplete rides, not completed ones.

Business Recommendations:

- Prioritize Addressing "No Driver Found" Status:**
 - Recommendation:** Conduct a deep dive into records with `Booking Status` = 'No Driver Found'. Analyze `Date`, `Time`, and `Pickup Location` to identify specific periods or geographies where driver supply is consistently insufficient.
 - Action:** Implement dynamic pricing strategies, driver incentives, or targeted driver recruitment campaigns in identified low-supply areas/times. Improve driver-matching algorithms.
- Analyze and Mitigate Ride Failures (Cancellations & Incomplete Rides):**
 - Recommendation:** Perform a detailed analysis of `Reason For Cancelling By Customer`, `Driver Cancellation Reason`, and `Incomplete Rides Reason`. Identify the most frequent root causes.
 - Action:**
 - If 'Vehicle Breakdown' (sample data) is a common `Incomplete Rides Reason`, enhance vehicle maintenance programs.
 - If customer cancellations are high due to long wait times, work on driver assignment speed.
 - If driver cancellations are frequent, investigate driver concerns (e.g., unfair fares, difficult customers, far pickup locations).
- Enhance Service Quality and Reliability:**
 - Recommendation:** Monitor `Driver Rating` and `Customer Rating` metrics. Identify drivers with consistently low ratings for targeted training or support. Similarly, identify customers who frequently receive low ratings.
 - Action:** Implement driver performance improvement programs. Consider feedback mechanisms for customers to address their concerns directly.
- Optimize Pickup Efficiency:**
 - Recommendation:** Analyze `Avg_VTAT` and `Avg_CTAT` for completed rides. High averages might indicate inefficiencies.
 - Action:** Streamline the driver assignment process to reduce `Avg_VTAT`. Communicate expected driver arrival times more clearly to customers to potentially reduce `Avg_CTAT`.
- Leverage Time and Location Data for Strategic Planning:**
 - Recommendation:** Utilize `Date`, `Time`, `Pickup Location`, and `Drop Location` to understand demand patterns and operational challenges over time and across geographies.
 - Action:** Forecast demand more accurately to optimize driver availability. Identify high-value routes or areas for focused marketing. Understand the impact of specific locations on cancellation rates or booking values.
- Investigate Booking Value & Ride Distance Discrepancies:**
 - Recommendation:** Analyze `Booking Value` in relation to `Ride Distance` for completed rides. Look for anomalies or unexpected variances that might indicate pricing issues or operational errors.
 - Action:** Refine pricing models to ensure fair and competitive rates for both customers and drivers, aligned with distance.
- Payment Method Analysis:**
 - Recommendation:** Analyze the distribution and success rates of different `Payment Method` options.
 - Action:** Ensure all popular payment methods are supported and function seamlessly. Investigate any payment method-specific issues or preferences.

4319618.0

Future Prediction

4310548.49

Expected Change

-0.21%

Forecast trend: Decreasing

AI Forecast Explanation

Here is a short business forecast explanation:

- Forecast Observation:** The "ForecastValue" is predicted to decrease from a historical last value of 4,319,618.0 to a future predicted value of 4,310,548.49. This represents an expected change of -0.21%.
- Trend Explanation:** The forecast indicates a decreasing trend for "ForecastValue" in the upcoming period.
- Assumptions and Limitations:** This forecast is based exclusively on the provided historical data and the predictive model's output. External factors or specific drivers behind this change are not available within the provided information. It is assumed that the historical patterns informing this forecast will persist. This is a predictive estimate, and actual outcomes may differ.

Future Prediction

Executive Summary

Executive Business Intelligence Report

Date: 2024-03-27

This report provides an executive summary of our generic booking and ride-hailing operations based on the latest dataset and available Key Performance Indicators (KPIs).

1. Overall Business Performance

The business processed a significant volume of activities, with 150,000 total bookings recorded. These bookings generated a Total Value of \$1,846,183.0, reflecting the overall financial contribution from services rendered. The Average Value per booking stands at \$88.3, indicating a consistent per-service monetary contribution.

On average, each ride covered a distance of 24.64 units (e.g., kilometers). Service quality metrics show a Customer Rating of 4.4 and a Driver Rating of 4.23, indicating generally positive satisfaction levels for both customers and drivers involved in the services.

2. Key Trends and Patterns

- Service Volume and Value:** The substantial number of bookings and associated total value demonstrates a robust operational scale.
- Service Quality Perception:** Customers tend to rate their overall experience slightly higher (4.4) compared to the ratings received by drivers (4.23). This suggests a generally satisfactory service experience, with potential room for improvement focusing on the driver aspect of service delivery.
- Data Completeness Challenge:** A critical pattern observed is the very high volume of 1,123,500 missing values across the dataset. This represents a significant portion of the total data points, affecting the reliability and depth of potential analysis for various operational aspects.
- Operational Indicators Present:** The presence of columns like 'Booking Status', 'Cancelled Rides by Customer', 'Reason for cancelling by Customer', 'Cancelled Rides by Driver', 'Driver Cancellation Reason', 'Incomplete Rides', and 'Incomplete Rides Reason' indicates that monitoring service reliability and addressing issues related to cancellations and incomplete bookings are core operational considerations.

Note: Time-based trend analysis is not available from the provided KPIs.

3. Major Risks or Concerns

- Significant Data Quality Issues:** The presence of 1,123,500 missing values is the most critical risk. This level of incompleteness severely limits the ability to perform detailed root cause analysis, understand performance drivers, and make data-driven decisions across various operational areas (e.g., specific vehicle types performance, location-based issues, payment method analysis, or detailed reasons for cancellations and incomplete rides).
- Potential Service Reliability Gaps:** While specific rates are not available, the existence of columns tracking 'Cancelled Rides by Customer', 'Cancelled Rides by Driver', and 'Incomplete Rides' indicates that these are recurring events. Without complete data and specific metrics, the actual impact and underlying causes of these service disruptions remain unknown, posing a risk to customer satisfaction and operational efficiency.
- Driver Satisfaction and Performance:** The slight discrepancy between customer ratings (4.4) and driver ratings (4.23) could point to areas where driver performance or satisfaction needs attention. A decline in driver satisfaction or performance could eventually impact overall service quality and customer experience.

4. Strategic Recommendations

1. Prioritize Data Quality Enhancement:

- Action:** Immediately investigate the sources and reasons for the 1,123,500 missing values across the dataset. Implement robust data collection and validation processes to ensure completeness and accuracy moving forward.
- Impact:** This is foundational for any meaningful analytical work and will enable a deeper understanding of all operational aspects, from booking trends to reasons for cancellations.

2. Deep Dive Into Service Reliability:

- Action:** Once data quality is improved, analyze the 'Booking Status', 'Cancelled Rides by Customer', 'Reason for cancelling by Customer', 'Cancelled Rides by Driver', 'Driver Cancellation Reason', 'Incomplete Rides', and 'Incomplete Rides Reason' columns. Quantify the rates of cancellations and incomplete bookings, identify primary reasons, and pinpoint high-impact areas (e.g., specific vehicle types, locations, or times).
- Impact:** Proactively address systemic issues leading to service disruptions, improving customer satisfaction and operational efficiency.

3. Enhance Driver Engagement and Performance:

- Action:** Investigate the reasons behind the slightly lower Driver Ratings compared to Customer Ratings. This could involve driver feedback, training programs, or incentives to improve their experience and service delivery.
- Impact:** Foster a more engaged and higher-performing driver base, which directly contributes to a superior customer experience and potentially reduces driver-initiated cancellations.

4. Leverage Operational Insights for Optimization:

- Action:** Utilize columns such as 'Vehicle Type', 'Pickup Location', 'Drop Location', and 'Payment Method' (once data quality is ensured) to identify patterns in demand, optimize resource allocation, and tailor service offerings.
- Impact:** Drive operational efficiencies, potentially increase booking value, and enhance customer experience by aligning services more closely with market needs.
